How much of the taught material is actually applicable in the real world?

- Very little; the majority of your skills will be acquired through self-study. However, the curriculum does act as a helpful guide to point your independent research in the right direction.

Which operating systems are utilized within the PNFI?

- Typically, the department runs Linux in the student labs for practical sessions. On the other hand, instructors are often seen using Windows for their personal work because it is much more user-friendly.

Isn't using proprietary software prohibited in public institutions?

- In theory, public entities are mandated to exclusively use open-source operating systems. Yet, due to a lack of institutional training, staff tend to fall back on an easier, more manageable OS like Windows.

How many programming languages are covered in the coursework?

- Only a handful of foundational ones, such as HTML, CSS, and C++. It is ultimately up to you as a student to dive deeper and master more up-to-date programming languages on your own.

How many subjects involve genuine hands-on practice?

- It depends on the course: some are only covered on a surface level, while others—such as advanced networking and computer security—involve in-depth practical work.

How many routing protocols do we study?

- We look at around eight in total. However, the most critical ones that involve "VLSM" configurations are OSPF and BGP.
